≥ greater than or equal to
≤ less than or equal to
Roman numerals
integer, positive, negative
above/below zero,
negative numbers
formula - a mathematical rule written using symbols, usually as an equation describing a certain relationship between quantities.
Divisibility - can be divided evenly without leaving a remainder.
factorise - the reverse of expanding brackets.
prime factor - a prime number that divides exactly into another given number.
ascending/descending order
digit total – the sum of all the digits in a number, e.g. the digit total of 364 is $3+6+4 = 13$

- Pupils know the value of each digit in a number up to 10 000 000
- Know why it is helpful to round numbers, e.g. when estimating calculations or when working with very large numbers such as populations.
- Know where to put commas or separators when writing numbers greater than 10 000
- Pupils will know the inequality symbols $<$ and $>$

Stem Sentences

One million is one thousand thousands.

The _____ represents _____.

The value of the _____ is _____.

a is between _____ and _____.

The previous multiple of one million is _____. The next multiple of one million is _____.

a is nearest to _____.

- Pupils understand the importance of the placeholder in numbers
- Pupils understand which place value column to look at when rounding numbers
- Pupils understand which two numbers a given number lies between when rounding.
- Pupils understand the convention of rounding up if numbers are exactly halfway
- Pupils understand where negative numbers are used in real life contexts

- Can use negative numbers in context and calculate intervals across zero
- Can read, write, compare and order numbers up to 10 000 000
- Can round any number to a required degree of accuracy

<p>Multiplication Multiply Multiplied by Groups of Times Repeated addition</p> <p>Multiple - The result of multiplying a number by an integer (not by a fraction).</p> <p>Common multiple - A multiple that is common to two or more numbers.</p> <p>Factor - Numbers we can multiply together to get another number.</p> <p>Common factor - When we find the factors of two or more numbers, and then find some factors are the same ("common"), then they are the "common factors".</p> <p>Multiplicand – The number to be multiplied</p>	<ul style="list-style-type: none"> Pupils know that 'long multiplication' is an algorithm involving multiplication, then addition of partial products. Pupils know that remainders can be expressed as a whole number, a fraction or a decimal. Pupils know how to use a systematic approach to find all the common factors of numbers. Pupils know that in mixed operation calculations, calculations are not carried out from left to right. Pupils know the convention that when there is no operation sign written, this means multiply. Pupils know when it is more efficient to carry out a mental strategy rather than a written computational method. <p>Stem Sentences</p>	<ul style="list-style-type: none"> Pupils understand that when multiplying two numbers that are multiples of 10, 100 or 1000, you multiply the number of tens, hundreds or thousands and then adjust the product using place value. e.g. 30×40 $= 3 \times 4 \times 10 \times 10$ $= 3 \times 4 \times 100$ $= 12 \times 100$ $= 1,200$ Pupils understand the compensation property of multiplication, e.g. $5 \times 8 = 10 \times 4$. Pupils understand that two two-digit numbers can be multiplied by partitioning one of the factors, calculating partial products and then adding these partial products together. This can be extended to multiplying three-digit numbers by two-digit numbers. Pupils understand how partitioning in different ways, other than 	<ul style="list-style-type: none"> Pupils can use short multiplication to multiply numbers by a single-digit number. Pupils can use long multiplication to multiply numbers by a two-digit number. Pupils can multiply and divide by 10, 100, 1000 using concrete and pictorial representations and then by visualising place value charts. Pupils can use the compensation property of multiplication to complete equations such as $0.3 \times 320 = 3 \times ?$, and to help them solve calculations such as 0.3×320. Pupils are able to list multiples of the divisor to help them solve divisions more easily. Pupils can find common factors of numbers. Pupils can find whether or not a number up to 100 is prime.

<p> Term to term rule Variable Unknown Expression Equation Formula One-step equation Two-step equation Substitution Pairs of unknown enumerates </p>	<ul style="list-style-type: none"> Pupils know that forming algebraic expressions uses letters to represent numbers. Pupils know the convention that, for example, "3t" means 3 multiplied by t; as multiplication can represent repeated addition, this is also a simpler way of writing $t + t + t$. 	<ul style="list-style-type: none"> Pupils understand the meanings of the terms "input", "output", "function" and "rule". Pupils understand why it is important that they follow the order of the functions; for example, the output of $\times 5$ then $+ 3$ will be different from $+ 3$ then $\times 5$. Pupils understand that phrases such as "2 more than a number" can be written more simply as, for example, "$x + 2$" or "$y + 2$". Pupils understand that the same expression can have different values depending on what number is substituted into it. Pupils understand the difference between a formula and an expression, noticing that an expression does not have the equals sign, but a formula does. Pupils understand that an expression, such as $2x + 6$, changes value depending on the value of x, whereas in an equation, such as $2x + 6 = 14$, x has a specific value. Pupils understand that using inverse operations helps to solve equations. 	<ul style="list-style-type: none"> Pupils can find the input from a given output, using inverse operations. Pupils can find numbers where the input is given and they need to find the output, using a mix of any of the four operations. Pupils can find a rule. Pupils can solve problems where the input and output are given, but one of the two functions is missing. Pupils can find values of expressions by substituting numbers in place of the letters. Pupils can substitute numbers into abstract algebraic expressions such as $3a + 1$. Pupils can use substitution to work out pairs of possible values. For example, if $x + y = 9$, they find the values of y for different values of x. Pupils can work systematically to find all the possible integer values.

<p>Proportion in every, for every per cent, % - out of one hundred. Derived from the Latin per centum, meaning "hundred" or "by the hundred".</p> <p>percentage,</p>	<ul style="list-style-type: none"> Pupils know that per cent means "out of a hundred". Pupils know the symbol % Pupils know that to find 10% of a number you must divide by 10. Pupils know that converting a decimal to a fraction is helpful when converting to percentages. Pupils know to convert fractions, decimals and percentages to the same form so that they can be more easily ordered and compared. <p>Stem Sentences</p> <p>50% = $\frac{1}{2}$ so we divide into 2 equal parts.</p> <p>25% = $\frac{1}{4}$ so we divide into 4 equal parts.</p> <p>20% = $\frac{1}{5}$ so we divide into 5 equal parts.</p> <p>10% is equivalent to $\frac{1}{10}$. To find 10% of an amount, divide by 10.</p> <p>1% is equivalent to $\frac{1}{100}$. To find 1% of an amount, divide by 100.</p>	<ul style="list-style-type: none"> Pupils understand that percentage is a measure of proportion. Pupils understand that 'per cent' relates to 'number of parts per hundred'. Pupils understand the connection of percentages, fractions and decimals. Pupils understand the difference between tenths and hundredths and their equivalent percentages, e.g. understanding that 0.1 is 10% not 1%. Pupils understand there may be more than one way to solve a problem involving percentages and some ways are more efficient than others. Pupils understand how to find the whole when they are given a percentage, e.g. If 10% of a number is 7, what is the number? 	<ul style="list-style-type: none"> Pupils can draw bar models to represent a quantity as 100% Pupils can determine multiples of 10% of a number or quantity using the bar model. Pupils can find percentages of amounts, e.g. 35% by finding multiples of 10% and other known percentages. Pupils can convert fractions to equivalent fractions where the denominator is 100 in order to find the percentage equivalent. $\frac{12}{50} = \frac{\square}{100} = \square\%$ <ul style="list-style-type: none"> Children can convert between fractions, decimals and percentages to enable them to order and compare them. Pupils can use a bar model to show an increase and decrease in amounts.

<p>Ratio Proportion “for every... there are...” Part Whole Scale factor Enlargement Similar shapes Length Width perimeter</p>	<ul style="list-style-type: none"> • Pupils know that ratio represents a multiplicative relationship between two amounts. • Pupils know the ratio symbol as a colon. • Pupils know that the wording, “For every , there are ” can be written as : . • Pupils know, and convey in their answers, which number refers to which value. • Pupils know that simplifying ratios is similar to simplifying fractions and that both involve dividing by common factors. • Pupils know that one shape is an enlargement of another if all the matching sides are in the same ratio. • Pupils know that similar shapes are shapes where corresponding sides are in the same proportion and the corresponding angles are equal, so if one shape is an enlargement of the other, the two shapes are similar. 			<ul style="list-style-type: none"> • Pupils understand that the relationship between two numbers can be expressed additively or multiplicatively. For example, the relationship between 3 and 9 can be expressed as an addition ($3 + 6 = 9$) or a multiplication ($3 \times 3 = 9$). • Pupils understand the inverse relationships related to each of these, for example $9 - 6 = 3$ and $9 \div 3 = 3$. • Pupils understand multiplicative relationships by using the language such as “3 times the size” and “a third of the size”. • Pupils understand how one value is related to another by making simple comparisons, such as: “For every 2 blue counters, there are 3 red counters.” • Pupils understand that the order in which the notation is used is important. For example, for every 2 red cubes there are 3 blue cubes, so red to blue is 2 : 3. For every 3 blue cubes, there are 2 red cubes, so blue to red is 3 : 2. 			<ul style="list-style-type: none"> • Pupils can complete sequences of numbers, deciding whether each relationship is additive or multiplicative. • Pupils can relate ratio to their understanding of simplifying fractions. • Pupils can explore ratio when given a fraction as a starting point. For example, they are told that $1/4$ of a group of objects is blue, and they need to find the ratio of blue to not blue. • Pupils can explore different ways of calculating scaled lengths using multiplicative relationships between numbers. For example, if 3 cm represents 9 cm, then to find what 6 cm represents they can either multiply 9 cm by 2 or multiply 6 cm by 3 to find the result, 18 cm. • Pupils can use familiar language such as “3 times as big” before being introduced to the language of scale factors, for example “enlarged by a scale factor of 3”.

	<ul style="list-style-type: none"> Pupils know that when they multiply or divide from one amount to another, they do the same for the other value to keep the ratios equivalent. 	<ul style="list-style-type: none"> Pupils understand that the same ratio can be written in different forms, for example 4 : 6 can be written as 2 : 3. Pupils understand the differences and similarities between ratios and fractions. Pupils understand that a ratio compares one item with another, whereas fractions compare each part with the whole. Pupils understand if diagrams are accurately scaled or if the proportion of the dimensions has been changed. Pupils understand the language of "Each square represents ..." to explain the relationship between the original image and its scale drawing. 	<ul style="list-style-type: none"> Pupils can draw the result of an enlargement by a given scale factor. Pupils can identify the scale factor of an enlargement when presented with both images. Pupils can use the inverse operations to find the dimensions of the original shape given the size of the enlargement. Pupils can represent problems using bar models.

<p>bar chart, pictogram frequency table, tally chart pie chart discrete data, continuous data line graph sum, difference comparison interpret mean average</p>	<ul style="list-style-type: none"> Pupils know they can only read off approximate values for data that lies between two marked points, which is why a dashed line is used. Pupils know that time is usually shown on the horizontal axis. Pupils know that dual bar charts are used to compare data. Pupils know that pie charts are used to represent information as part of a whole. Pupils know that a whole pie chart represents 100% of the data, so one half represents 50%, one quarter represents 25% and so on. Pupils know the mean as an average. Pupils know the formula: $\text{mean} = \text{total number} \div \text{number of items}$. 	<ul style="list-style-type: none"> Pupils understand what each axis will represent Pupils understand the appropriate scales based on the numbers given. Pupils understand the importance of a key to ensure that the bar charts can be interpreted. Pupils understand that bar charts may show the numbers of most/least popular items quickly, whereas pie charts show something as more/less than a half/quarter etc. of the total. Pupils understand percentages, in the context of pie charts. Pupils understand efficient strategies for finding multiples of 10%, 20% and 25%. Pupils understand they can work out the value of t sections, using either the total or proportional reasoning (for example, knowing 40% must be 8 times the size of 5%). Pupils understand that they use division to work out how many degrees represent each item of data, and then multiplication to find the angle for each sector. Pupils understand what an average is and why averages are useful to summarise sets of data. Pupils understand how the mean is calculated, using addition and division skills. 	<ul style="list-style-type: none"> Pupils draw line graphs using given information. Pupils can answer problems involving line graphs. Pupils can infer what has happened in a given situation based on the information provided in the line graph. Pupils can interpret simple pie charts to identify the greatest/ least amounts. Pupils can use the total number represented by a pie chart to work out what each equal part is worth. Given the value of one part, pupils can work out the total and/or the values of other parts of the pie chart. Pupils can interpret pie charts where the total number is not given, and they need to work out the total from a given percentage. Pupils can draw simple pie charts, with each part being worth 50% or 25%, where they can easily see one half and one quarter of the chart. Pupils can construct pie charts where guidelines are provided, firstly in 10% intervals and then at 1% intervals.

<p>length centimetre metre millimetre kilometre mile foot, feet inch, inches</p> <p>weight mass tonne kilogram gram pound ounce</p> <p>capacity volume litre millilitre centilitre</p> <p>a.m., p.m. digital/analogue clock/watch, timer 12-hour clock time, 24-hour clock time</p>	<ul style="list-style-type: none"> Pupils know which operation to use when converting a smaller unit of measurement to a larger one and vice versa. Pupils know the difference between capacity (the amount an object can contain) and volume (the amount actually in an object). Pupils know the unit of measure that would be the most appropriate to measure different items. Pupils know that: 5 miles is approximately equal to 8 km. 1 foot is equal to 12 inches 1 pound is equal to 16 ounces 1 stone is equal to 14 pounds 1 gallon is equal to 8 pints 1 inch is approximately 2.5 cm Pupils know the symbol '≈' as "is approximately equal to". <p>Stem Sentences</p> <p>There are 1000 grams in a kilogram so to convert grams to Kilograms we divide by 1000.</p> <p>There are 100 centimetres in a metres so when we convert centimetres to metres, we divide by 100.</p>	<ul style="list-style-type: none"> Pupils understand the link between multiplying and dividing by 10, 100 and 1,000 when converting between units of length, mass and capacity. Pupils understand the role of zero as a place holder when performing some calculations, as questions will involve varied numbers of decimal places. Pupils understand how to work out what each mark is worth on a scale. 	<ul style="list-style-type: none"> Children read, write and recognise all metric measures for length, mass and capacity. Pupils can convert between metres, centimetres and millimetres; litres and millilitres; kilograms and grams; seconds, minutes and hours etc Pupils can use a ruler to measure 2-D shapes. Pupils can use decimals to express units of measure when converting. Pupils can compare measurements in different units and determine 'greater than', 'less than' and 'equal to'. Pupils can find approximate conversions from miles to km and from km to miles. Pupils can perform related conversions, both within imperial measures and between imperial and metric. Pupils can determine how many seconds there are in a minute, how many minutes in an hour, how many hours in a day, and so on. Pupils can find fractions of time and convert these into decimals using division.

<p>perimeter area volume cubic units (e.g. cm³) cuboid width length rectangle rectilinear parallelogram perpendicular height</p>	<ul style="list-style-type: none"> Pupils know the differences between area and perimeter. Pupils know the formula $A = L \times W$ to find areas of rectangles. Pupils know methods for finding the perimeters and areas of rectangles and rectilinear shapes and compare their efficiency. Pupils know whether they need to add or subtract to find the area of a rectilinear shape. Pupils know the formula $\text{area} = \frac{1}{2} \times \text{base} \times \text{perpendicular height}$. Pupils know the properties of a parallelogram and compare to a rectangle. Pupils know that the area of a parallelogram can be found by using the formula $\text{area} = \text{base} \times \text{perpendicular height}$. Pupils know they can find the volume by multiplying the volume of a single layer by the number of equal layers. Pupils know the formula: volume of cuboid = length \times width \times height. 			<ul style="list-style-type: none"> Pupils understand that shapes can look different but still have the same area. Pupils understand when multiplication can be used to find the areas of shapes. Pupils understand they can use factor pairs rather than relying on counting squares to calculate and draw rectangles that have the same area. Pupils understand that when finding the area of a rectilinear shape, they look for the most efficient way to split the shape rather than always splitting it the same way. Pupils understand how to calculate unknown side lengths. Pupils understand when it may be efficient to find the area of a rectilinear shape by subtracting the missing part from the area of a whole rectangle. Pupils understand the links between the area of a rectangle and the area of a triangle. Pupils understand that a right-angled triangle with the same length and perpendicular height as a rectangle has an area that is half the area of the rectangle. 			<ul style="list-style-type: none"> Pupils can find the areas of shapes by counting squares and then identify shapes that have the same area. Pupils can estimate the areas of triangles that involve sections of squares greater and less than half. Pupils can create their own triangles with a specific area. Pupils can identify the correct parts of the triangle. Pupils can find the areas of triangles where only the base and perpendicular height are given. Pupils can find the areas of triangles where more measurements are given. Pupils can use multiplication to find the number of cubes in one "layer" of the shape and then multiply this by the number of layers to find the total volume. Pupils can find the most efficient method to calculate the volume using the associative law of multiplication.

		<ul style="list-style-type: none"> Pupils understand that the perpendicular height is not always the length of one of the sides. Pupils understand that the base is not always at the bottom of a triangle and sometimes there may be more than one possible calculation they could use to find the area. Pupils understand how the parts of the parallelogram can be rearranged to make a rectangle in which the length and width correspond to the base and perpendicular height of the parallelogram. Pupils understand the relationship between the total volume of a cuboid and its length, width and height.
